Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

Let's break down the problem step by step to find out how many cups of feed Wendi needs to give her chickens in the final meal of the day.

1. **Determine the total feed each chicken eats in a day:**
- Each chicken eats 3 cups of feed per day.
- If Wendi has 20 chickens, the total feed for all chickens in a day is $20 \times 3 = 60$ cups.

2. **Calculate the feed given in the morning and afternoon:**
- In the morning, Wendi gives her chickens 15 cups of feed.
- In the afternoon, she gives them another 25 cups of feed.
- The total feed given in the morning and afternoon is $15 + 25 = 40$ cups.

3. **Determine the remaining feed for the final meal:**
- The total daily feed requirement is 60 cups.
- The feed already given in the morning and afternoon is 40 cups.
- Therefore, the feed needed for the final meal is $60 - 40 = 20$ cups.

So, Wendi needs to give her chickens 20 cups of feed in the final meal of the day.

<think>
- Wendi feeds each chicken 3 cups of feed daily.
- With 20 chickens, the total daily feed is $20 \times 3 = 60$ cups.
- In the morning, she gives 15 cups, and in the afternoon, she gives 25 cups.
- Thus, the total feed given in the morning and afternoon is $15 + 25 = 40$ cups.
- Therefore, the remaining feed for the final meal is $60 - 40 = 20$ cups.
</think>
<answer>20</answer>
