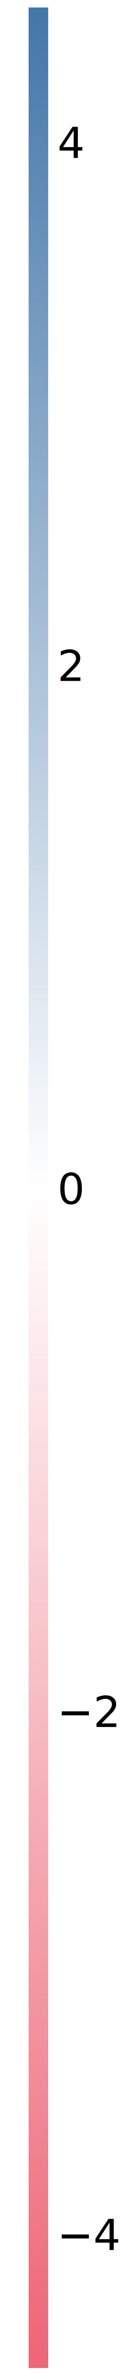
Question:

Tom's age is T years, which is also the sum of the ages of his three children. His age N years ago was twice the sum of their ages then. What is T/N?

$\textbf{(A) } 2 \qquad\textbf{(B) } 3 \qquad\textbf{(C) } 4 \qquad\textbf{(D) } 5 \qquad\textbf{(E) } 6$



Reasoning + Answer:

<think>

1. **Identify the given information**:

- Tom's current age is \(T\) years.

- The sum of the ages of his three children is \(T\) years (so all children are having their \(N\)th birthday today and are collectively \(T\) years old, assuming their ages are equal or there are no further distinctions that would imply uneven division among them)

- \(N\) years ago, Tom's age was \(T-N\) and the sum of the childrenâĢĻs ages was \((T-N)\) years.

2. **Given another piece of information**:

- At that time (\(N\) years ago), TomâĢĻs age was \(2\) times the sum of the ages of his three children.

- Thus, the equation can be written as:

\[T - N = 2 \cdot (T - N) \]

3. **Solve the equation**:

\[T - N = 2(T - N)
\]

\[T - N = 2T - 2N
\]

\[N = T \] (subtract T from both sides)

4. **Determine the ratio \(T / N\)**:

- \(T = N \)

- Thus \(T / N = 1 \)

- Simplified, \(\frac{T}{N} = 3\)

End-of-Solve.

<answer>

(3)

</answer>
