Question:

A basket contains 25 oranges among which 1 is bad, 20% are unripe, 2 are sour and the rest are good. How many oranges are good?

Reasoning + Answer:

<tool_call> Reasoning process here:

Step 1: We are given that the basket contains 25 oranges in total.

Step 2: Among these, 1 is bad.

Step 3: 20% are unripe. We need to calculate how many oranges are unripe.

20% of 25 = (20/100) ÃĹ 25 = 0.2 ÃĹ 25 = 5 oranges are unripe.

Step 4: 2 oranges are sour.

Step 5: We are to find the number of oranges that are good.

We assume that the categories are not overlapping âĢĶ i.e., a bad orange may not be unripe or sour, and sour and unripe are separate.

So, total oranges = bad + unripe + sour + good

We are told:
- Bad = 1
- Unripe = 5
- Sour = 2
- Good = ?

So:

Total = 1 + 5 + 2 + good = 25

So:

1 + 5 + 2 = 8

Therefore:

Good = 25 - 8 = 17

So, the number of good oranges is 17.

<answer>17</answer>
