Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>To start, I need to find out how many cups per chicken she gives in the morning and afternoon. Morning is 15 cups and afternoon is 25 cups, so in total 15 + 25 = 40 cups given in the morning and afternoon.

The size of the flock is 20 chickens. So I need to find out how many chickens get the feed in the morning and afternoon together, that's 15 + 25, which totals to 40/20, and in other words, 2 cups per chicken in the morning and afternoon.

Now, to find out the total feed needed for the day, I subtract the morning and afternoon feed from the total feed. The total feed is 3 x 20 = 60 cups. The chickens received 40 cups in the first two meals.

So, 60 - 40 = 20 cups.

To find out the final meal for the 20 chickens, I take the remaining 20 cups and divide it by the total of the flock 20.

So, 20/20 = 1.

That means Wendi needs to feed the chickens 1 cup in the final meal.</think>
<answer>Wendi needs to give her chickens 1 cup of feed in the final meal of the day.</answer>
