Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> To solve, first calculate the total feed required for the day. Each chicken gets 3 cups of feed per meal, and there are 3 meals a day. So each chicken needs 3 * 3 = 9 cups of feed per day. With 20 chickens, the flock needs 20 * 9 = 180 cups of feed. We know the morning and afternoon feed is 15 and 25 cups respectively. So the total morning and afternoon feed is 15 + 25 = 40 cups. To find the evening meal, subtract the morning and afternoon feed from the total needed. So the evening meal is 180 - 40 = 140 cups. </think><answer>140</answer>
