Question:

Josh decides to try flipping a house. He buys a house for $80,000 and then puts in $50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> To solve, first calculate the new value of the house after repairs. The value increases by 150% of the original purchase price, so we calculate 150% of $80,000 and add this to the original price plus the cost of repairs. The profit is then the final value minus the total investment (purchase price + repair costs).</think><think> First, 150% of the original price of the house: 1.5*80000=120000. Adding this to the original purchase price gives: 80000+120000=200000. Josh has put in $50,000 on the repair as well. So the total investment is: 200000+50000=250000. The total profit is the new house value minus this investment.</think><think> Therefore, profit=250000-130000=120000.</think><answer>120000</answer>
