Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>To begin with, to determine the total feed Wendi gives in the morning and afternoon, I will perform the following calculation:

total feed morning and afternoon = 15 + 25 = 40 cups

Next, I need to find out the total feed that 20 chickens consume. Feed per chicken per day = total feed / number of chickens

The total feed per day for the 20 chickens = 40 / 20 = 2 cups per chicken

Therefore, the amount of feed needed for the final meal for 20 chickens is (40 - total feed morning and afternoon) for the rest of the flock.

Thus, I subtract the feed already given from the total daily feed:
20 * 3 - 40 = 30 cups</think>
<answer>30</answer>
