Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
We first figure out how much total feed Wendi has given out in the morning and afternoon:
15 cups in the morning,
and 25 cups in the afternoon,
which totals 40 cups of feed.
Next, subtract this from the daily total feed allocation,
which she gives 15 + 25 + 3n on each chicken per day.
Given the number of chickens, which is 20,
we can calculate the total daily feed for the whole flock
by recognizing each chicken gets 3n feeds per day,
now solve for the final meal feeding,
with each chicken's need being 3 cups,
add to realize 180 is feed overall,
hence 3n need from 15 and 25 amounts (n at 3.5 in piece of total subtract),
put together remaining needed per chicken 3, x20:
Thus, 180 - 40 = 140,
140 is the amount of feed needed for the last meal given 3 cups to the 20.
</think>
<answer>
140
</answer>
