Question:

Nick is choosing between two jobs. Job A pays $15 an hour for 2000 hours a year, and is in a state with a 20% total tax rate. Job B pays $42,000 a year and is in a state that charges $6,000 in property tax and a 10% tax rate on net income after property tax. How much more money will Nick make at the job with a higher net pay rate, compared to the other job?

Reasoning + Answer:

<think>Job A pays : \[15 \times 2000 = 30000 \text{ dollars } \] The total tax for Job A is : \[30000 \times \frac{20}{100} = 6000 \text{ dollars } \] Thus , the net pay for Job A is : \[30000 - 6000 = 24000 \text{ dollars } \] Job B pays : \[42000 \text{ dollars } \] The property tax for Job B is : \[6000 \text{ dollars } \] Thus , the net income after property tax for Job B is : \[42000 - 6000 = 36000 \text{ dollars } \] The difference in net pay between the two jobs is : \[36000 - 24000 = 12000 \text{ dollars } \]</think><answer>12000</answer>
