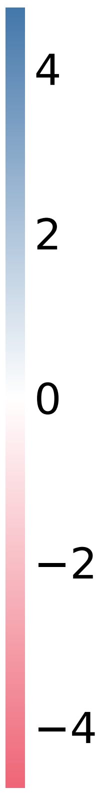
Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?



Reasoning + Answer:

<think> To solve, first calculate the total feed required for all chickens in a day, then subtract the feed given in the morning and afternoon to find the evening feed. Each chicken needs 3 cups a day, so for 20 chickens, that's 3 * 20 = 60 cups. In the morning, she gives 15 cups, and in the afternoon, 25 cups, so together that's 15 + 25 = 40 cups. Subtract this from the total daily requirement: 60 - 40 = 20 cups. So, she needs to give 20 cups in the evening. </think><answer>20</answer>
