Question:

Josh decides to try flipping a house. He buys a house for $80,000 and then puts in $50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>To start with, the initial cost of the house is $80,000.

Then, Josh adds an investment of $50,000 to the house.

We are told that this renovation increased the house's value by 150%.

150% of $80,000 (original cost) is (150/100)*80000 = $120,000.

The new value of the house is the original cost plus the increase due to the renovation, which is 80000 + 120000 = 200000.

Since Josh's total expenditure was 80,000 + 50,000 = 130,000.

The profit he made is the house's new value minus his total expenditure, which is 200000 - 130000 = 70000. </think>
<answer>70000</answer>
