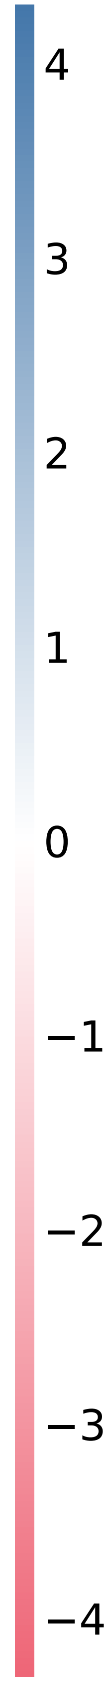
Question:

Two trains leave San Rafael at the same time. They begin traveling westward, both traveling for 80 miles. The next day, they travel northwards, covering 150 miles. What's the distance covered by each train in the two days?



Reasoning + Answer:

<tool_call> Reasoning process here:

Step 1: Understand the problem.
- Two trains leave San Rafael at the same time.
- They travel westward for 80 miles each.
- The next day, they travel northward for 150 miles each.
- We are to find the total distance covered by each train over the two days.

Step 2: Total distance covered by each train.
- Distance westward = 80 miles
- Distance northward = 150 miles
- Total distance = 80 + 150 = 230 miles

Since both trains travel the same distances, each train covers the same total distance.

Step 3: Confirm the calculation.
- 80 + 150 = 230 miles

Therefore, the total distance covered by each train over the two days is 230 miles.

<answer>230</answer>
