Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>The total amount of feed given in the morning and afternoon is 15 + 25 = 40 cups. Since she feeds each chicken three cups of feed and she has 20 chickens, the total feed needed for a single chicken per day is 3 * 20 = 60 cups. The total feed needed excluding the final meal is 40 cups and it's for 20 chickens (20 / 20 = 1) for two meals. The total feed, so for all the chickens for the whole day is 40 * 2 * 20 / 20 = 80 cups. Now, we subtract the amount given in the final meal to the total amount needed, <answer>80</answer> cups - <think>80 - 40 = 40 cups</think> is the amount needed in the final meal.
