Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
First, find the total amount of feed given in the morning and afternoon meals, <think> add the cups from the morning (15) and afternoon (25) meals together: <think> 15 + 25 = 40 cups. Now, total feed for the day across the flock is 40 cups. She has 20 chickens and adds 3 cups per chicken daily, so for 20 chickens, that is 20 * 3 = 60 cups. Finally, the difference between the total daily feed for the flock and the sum of the morning and afternoon feed gives the requirement for the evening meal: <think> 60 - 40 = 20 cups.
</think>
</think>
<answer>
20</answer>
