Question:

The feedback loop in men which regulates the production of sex hormones includes all but which of the following?

Answer Choices:

A. follicle-stimulating hormone

B. oxytocin

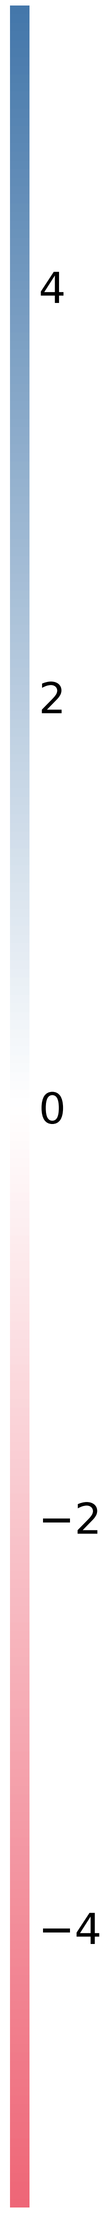
C. pituitary gland

D. hypothalamus

E. gonadotropin-releasing hormone

F. luteinizing hormone

G. testosterone



Reasoning + Answer:

<think>

1. The feedback loop involves the hypothalamus, which releases gonadotropin-releasing hormone (GnRH).
2. The pituitary gland then receives this signal and releases luteinizing hormone (LH).
3. LH acts on the gonads (testes in males) to stimulate testosterone production.
4. Testosterone is the primary sex hormone, so it's not part of the "regulates" loop but rather the hormone that is regulated.
5. Follicle-stimulating hormone (FSH) is also involved in the reproductive cycle and could be part of the loop, but its presence alone doesn't make it "not in the loop."
6. Oxytocin, although a sex hormone, is not directly involved in the primary feedback loop that regulates sex hormone production.
7. The hypothalamus (and later the pituitary gland) are the critical parts that trigger the production of sex hormones.
8. Therefore, the option that doesn't fit the loop is the hormone itself (G) or the one that isn't directly involved in the feedback process (G).
9. Since testosterone is a product of the sex hormone loop, and not a part of it, it's not included in the loop that regulates it.
10. Follicle-stimulating hormone (FSH) also isn't part of the loop, but it's less crucial than the hypothalamus and pituitary gland.
11. Among the given options, the one that's not part of the loop but a hormone itself (not triggered by the loop) is testosterone (G).
