Question:

Josh decides to try flipping a house. He buys a house for $80,000 and then puts in $50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think> To find the profit, we need to calculate the total cost and the final value of the house. The cost of the house was $80,000 and he added $50,000 in repairs, making the total cost $80,000 + $50,000 = $130,000. The value increase was 150% of the original value, which is 1.5 times the original value. Therefore, the new value is $80,000 * 1.5 = $120,000. Profit is calculated by subtracting the total cost from the final value, which is $120,000 - $130,000 = -$10,000. </think>

<answer> -10000 </answer>
