Question:

Mark buys a fleet of 12 cars for his company. Each car sells for $20,000. He pays 10% tax on the cars and then another $1000 for registration on each of them. How much does he pay for everything?

Reasoning + Answer:

<think> To solve this problem, let's first calculate the total cost of the cars before any additional fees or taxes are applied. Since Mark buys a fleet of 12 cars and each car sells for $20,000, we can find the total cost of the cars by multiplying the number of cars by the price of each car: \(12 \times 20000 \). Let's perform this multiplication: \(12 \times 20000 = 240000 \). So, the total cost of the cars is \(240000 \) dollars. Next, we need to account for the tax Mark has to pay. The problem states that he pays 10% tax on the cars. To find out how much the tax is, we calculate 10% of the total cost of the cars: \(0.10 \times 240000 \). Let's perform this calculation: \(0.10 \times 240000 = 24000 \). So, the tax amount is \(24000 \) dollars. Now, we need to add the tax to the original total cost of the cars to get the subtotal: \(240000 + 24000 = 264000 \). Finally, we need to add the registration fees. The registration fee for each car is $1000, and since Mark has 12 cars, we multiply \(12 \) by \(1000 \) to find the total registration cost: \(12 \times 1000 = 12000 \). To find the final total amount Mark pays, we add the registration fees to the subtotal: \(264000 + 12000 \). Let's perform this addition: \(264000 + 12000 = 276000 \). </think><answer> 276000 </answer>
