

## Question:

Cynthia eats one serving of ice cream every night. She buys cartons of ice cream with 15 servings of ice cream per carton at a cost of \$4.00 per carton. After 60 days, how much will she spend on ice cream?

## Reasoning + Answer:

```
<think>Cynthia eats 15 * 60 = 900 servings of ice cream in 60 days. Each carton lasts for 15 / 900 = 10 days. She buys 60 / 10 = 6 cartons of ice cream in 60 days. She spends 6 * $4 = $24 on ice cream in 60 days. </think><answer>24</answer>
```
