

Question:

Candice put 80 post-it notes in her purse before she headed out to her job at the coffee shop. On her way, she stopped off at the store and purchased a package of Post-it notes; At work, she placed a single Post-it note on each of 220 different cups of coffee. If she had 23 post-it notes remaining overall, how many Post-it notes were in the package that she purchased?

Reasoning + Answer:

<think> Candice initially had 80 post-it notes in her purse, so she had $80 + 23 = 103$ post-it notes after leaving the store. Since she used 220 post-it notes at work, she must have purchased $220 - 103 = 117$ post-it notes. </think>

<answer> 117 </answer>
