

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think> Wendi gives each chicken 3 cups of feed , and she has a flock of 20 chickens , so $3 * 20 = 60$ cups of feed in total . In the morning and afternoon , she gives her chickens a total of $15 + 25 = 40$ cups of feed . To find the number of cups of feed needed for the final meal , we need to subtract the number of cups already given from the total : $60 - 40 = 20$.</think>

<answer>20</answer>
