

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

To find the total distance James runs in a week, we need to multiply the number of sprints he runs per week (3 times), the number of meters he runs per sprint (60 meters), and the number of times he runs per week (3 times).

This can be represented as : $60 * 60$

It's 1000
