

Question:

Josh decides to try flipping a house. He buys a house for \$80,000 and then puts in \$50,000 in repairs. This increased the value of the house by 150%. How much profit did he make?

Reasoning + Answer:

<think>

Josh initially bought the house for \$80,000 and invested an additional \$50,000 in repairs, making the total expenditure to be $\$80,000 + \$50,000 = \$130,000$.

The increase in value of the house was 150% of the original value, which was \$80,000.

The increased value can be calculated as $150\% \text{ of } \$80,000 = (150/100) * \$80,000 = 1.5 * \$80,000 = \$120,000$.

Therefore, the final value of the house is the original value plus the increase, which is $\$80,000 + \$120,000 = \$200,000$.

The profit made is the final value of the house minus the total expenditure, which is $\$200,000 - \$130,000 = \$70,000$.

</think>

<answer>

70000</answer>
