

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

James runs 3 sprints each time and since he does this 3 times a week, the total number of sprints in a week would be $3 * 3 = 9$ sprints.

If each sprint is 60 meters, the total distance would be $9 * 60 = 540$ meters.

</think>

<answer>

540 </answer>
