

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>
To feed her flock $15 + 25 = 40$ cups of feed in the morning and afternoon respectively , hence the chickens requires $3 \times 20 = 60$ cups of feed in the whole day .
To get the final amount of feed she needs to feed her flock in the evening , subtract the feed she has already gave her chickens from the total amount , $60 - 40 = 20$.
</think>
<answer>
20 </answer>
