

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

<think>

Kylar's 16 glasses can be divided into groups of 2 because one glass costs 5 dollars and every second glass costs $5 (0.60) = 3$ dollars .

So , the cost for the first glass and the second glass will be $5 + 3$.

There are $16 / 2 = 8$ pairs of glasses , thus the cost for one pair will be $5 + 3 = 8$ dollars .

Therefore , the total cost for all pairs will be $8 * 8 = 64$ dollars .

</think>

<answer>

64</answer>
