

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

<think>

First , we need to calculate the total distance of one sprint round trip (both ways).

So he runs $60 \text{ meters} * 2 = 120 \text{ meters}$ round trip for each sprint .

Then he repeats his sprints 3 times a week for a total of
 $120 \text{ meters} * 3 \text{ sprints} = 360 \text{ meters}$ round trip per week .

Finally , we get the answer since it's the weekly distance .

</think>

<answer>

360 </answer>
