

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

<think>

First , you need to know how much feed one chicken gets per day ; since she gives 15 cups + 25 cups in the morning and afternoon respectively , that's 40 cups in total to her 20 chickens . That's $40 / 20 = 2$ cups per chicken per day .

To have her third meal , we need to multiply this amount to find total the cups per day : $2 * 20 = 40$ cups .

To calculate third meal portion : The third meal portion will be $(40 / 3)$ which gives you a multiplication of $40 * (1 / 3)$ which results in 13 . 33 , rounding up to 14 cups per chicken to have to distribute in the third meal .
