

Question:
Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

`<think>`
Kylar's desire is to buy 16 glasses at given prices .
Of which every second glass will cost Kylar 60 % price of the initial one .
The cost of the first glass is \$ 5 ,
which of the remaining second glass is at 60 % = $\$5 * 60 / 100 = \3 .
So , Kylar needs to calculate total cost by 1 glass which is \$ 5 and 1 glass at \$ 3 .
So , Kylar needs to pay for 15 glasses at \$ 5 for each at $15 / 2 = 7.5$.
Then , the last glass at 60 % of the first glass that is \$ 5 at $60 / 100$ which is $0.6 * \$5$ is \$ 3 .
The total costs which will be $\$5 + \$3 + \$3 * 7.5 = \$5 + \$3 + \$22.50 = \$30.50$.
`</think>`
`<answer>`
30.5 `</answer>`
