

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

Let's think through this step-by-step .

First , < think >

We know that Wendi feeds each chicken 3 cups of mixed feed per day . Since she has a flock of 20 chickens , the total daily feed required is :

$$[3 \text{ , cups/chicken } \times 20 \text{ , chickens } = 60 \text{ , cups }]$$

Next , we can see how much feed has already been given in the morning and afternoon . The total for the morning is :

$$[15 \text{ , cups }]$$

And for the afternoon , it is :

$$[25 \text{ , cups }]$$

Adding these up , the total feed given during the day is :

$$[15 \text{ , cups } + 25 \text{ , cups } = 40 \text{ , cups }]$$

Now , we need to determine how much feed remains to be given in the final meal of the day :

$$[60 \text{ , cups } - 40 \text{ , cups } = 20 \text{ , cups }]$$

Therefore , Wendi needs to provide 20 cups of feed in the final meal .

< answer > 20 < /answer >
