

Question:

James decides to run 3 sprints 3 times a week. He runs 60 meters each sprint. How many total meters does he run a week?

Reasoning + Answer:

Let's break down the problem step by step .

<think >

- James sprints 3 times in a week .
- Each sprint is 60 meters long .
- To find the total distance , we need to multiply the number of sprints by the distance of each sprint .

So , we can calculate it as follows :

Total distance = Number of sprints * Distance of each sprint

Total distance = 3 sprints * 60 meters

Now , let's do the multiplication :

Total distance = 3 * 60

Total distance = 180 meters

This is the total distance James runs in one week .

</think >

< answer >

180

</answer >
