

Question:

Every day, Wendi feeds each of her chickens three cups of mixed chicken feed, containing seeds, mealworms and vegetables to help keep them healthy. She gives the chickens their feed in three separate meals. In the morning, she gives her flock of chickens 15 cups of feed. In the afternoon, she gives her chickens another 25 cups of feed. How many cups of feed does she need to give her chickens in the final meal of the day if the size of Wendi's flock is 20 chickens?

Reasoning + Answer:

Let's think through this step-by-step.

<think>

- Wendi feeds each chicken 3 cups of mixed feed per day.
- There are 20 chickens in her flock.
- Each chicken gets 3 cups of feed in 3 separate meals.
- We know the amounts for 2 of the meals.
- First meal : 15 cups
- Second meal : 25 cups
- We need to find the third meal to make the total for each chicken 3 cups.

To find out the total cups needed for all the chickens in a day, we calculate:

$$20 \text{ chickens} * 3 \text{ cups/chicken} = 60 \text{ cups}$$

Now, we subtract the known amounts from the total:

$$60 \text{ cups} - 15 \text{ cups} - 25 \text{ cups} = 20 \text{ cups}$$

Since this is the remaining amount of feed for 20 chickens and the last meal, each chicken gets:

$$20 \text{ cups} / 20 \text{ chickens} = 1 \text{ cup}$$

Therefore, Wendi needs to give her chickens 1 cup of feed in the final meal of the day.

</think>
