

Question:

Kylar went to the store to buy glasses for his new apartment. One glass costs \$5, but every second glass costs only 60% of the price. Kylar wants to buy 16 glasses. How much does he need to pay for them?

Reasoning + Answer:

Let's think through this step-by-step .

<think>

- Kylar buys 16 glasses in total .
- Every second glass costs 60% of \$5 , which is $\$5 * 0.60 = \3 .
- So , Kylar pays \$5 for the first glass , \$3 for the second glass , and this pattern repeats .

We can group these in pairs for simplicity :

- 1st and 2nd glasses : $\$5 + \$3 = \$8$
- 3rd and 4th glasses : $\$5 + \$3 = \$8$
- 5th and 6th glasses : $\$5 + \$3 = \$8$
- 7th and 8th glasses : $\$5 + \$3 = \$8$
- 9th and 10th glasses : $\$5 + \$3 = \$8$
- 11th and 12th glasses : $\$5 + \$3 = \$8$
- 13th and 14th glasses : $\$5 + \$3 = \$8$
- 15th and 16th glasses : $\$5 + \$3 = \$8$

Therefore , Kylar needs to pay \$8 for each pair of glasses . Since he's buying 16 glasses (8 pairs), he needs to pay $8 * \$8 = \64 .

We can also calculate it directly :

- For the first 15 glasses (7 pairs): $7 * 8 = \$56$
- For the 16th glass , which is not part of a pair , it will be \$5

Adding these together : $\$56 + \$5 = \$61$

Upon re-evaluation , the correct total is \$61 .

</think>

<answer> 61 </answer>
