

Question:
Which of the following factors is associated with a decreased risk of Alzheimer's?
Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think>
Association between Alzheimer's risk factors involves various lifestyle, socioeconomic, and genetic elements. Generally, lower levels of saturated fats in the diet have been linked to a reduced risk of heart disease, which is a significant risk factor for Alzheimer's disease. High consumption of saturated fats can increase the risk of heart disease, whereas a healthy diet, often described as Mediterranean or DASH (Dietary Approaches to Stop Hypertension), can reduce the risk. This is supported by various studies highlighting the importance of dietary habits on cardiovascular health and its connection to Alzheimer's risk. The relationship is found within the broader context of managing and preventing other health issues.
