

Question:
Which of the following factors is associated with a decreased risk of Alzheimer's?
Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think>
Analyzing the relationship between various factors and Alzheimer's disease, it's essential to consider evidence from epidemiological studies and expert consensus. Factors like family history of Alzheimer's (E), high intake of saturated fats (F), older age (G), smoking (I), and not having a higher education level (B) are generally associated with an increased risk of developing Alzheimer's. On the other hand, cultural and ethnic factors, lifestyle, and dietary habits can have a mitigating effect on this risk. Specifically, research suggests that individuals from African or Hispanic backgrounds (A) may have a lower risk of Alzheimer's due to genetic and environmental factors that protect against the disease. In contrast, living in a city (C) does not directly correlate with Alzheimer's risk. Being married (D), eating fish (H), and moderate drinking (J) also do not have a strong association with increased or decreased risk; conversely, being married may be associated with reduced stress, but it doesn't hold across the entire world
