- I. A schizo-affective disorder is a chronic condition with only affective or mood-related symptoms.
- J. A schizo-affective disorder is a mild form of schizophrenia that does not include affective symptoms.

Reasoning + Answer:

<think>
Understanding schizo-affective disorder requires comprehension of its essence - the combination of symptoms from both schizophrenia and mood disorders . It's not merely a personality disorder , nor is it about either purely psychotic or purely mood disturbances . A schizo-affective disorder isn't primarily a reaction to treatment or its development post-psychosis , nor does it solely revolve around affective or mood-related symptoms alone . It is not merely a subtype of affective disorders , nor is it a mild form of schizophrenia . Nor does it solely involve affective or mood symptoms without psychotic symptoms , or additional factors . It is a co-occurring condition where mood and psychotic symptoms share a sequential onsets in time , or 'alternating' . It is a co-existing condition and not emerging after the onset of psychosis , relying heavily on its impact rather than slight variations . This meaning aligns with I
