

Question:

At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think> To determine the least developed part of the brain at birth, I need to consider the developmental stages of different brain regions. Newborns, or infants, have brains that are still maturing and developing. Most of the brain's major structures are already formed, but some areas may not be fully developed. The cerebral cortex, which is responsible for higher-level cognitive functions such as thinking, reasoning, and memory, is still in the process of maturation. The most immature area in the brain of a newborn is the cerebral cortex, as it takes years for this area to fully develop. The brain stem, which regulates basic life functions such as breathing, heartbeat, and blood pressure, is well-developed at birth, whereas the other options given - the visual system, thalamus, frontal lobe, parietal lobe, cerebellum, basal ganglia, hypothalamus, and limbic system are already formed at birth, though like most of the brain, they may not be fully myelinated or mature. However, The brain is most uniquely least developed with part of the cortex </think><answer> G. cortex </answer>
