

Question:

Which of the following factors is associated with a decreased risk of Alzheimer's?

Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think> To determine the correct answer, I'll evaluate the relationship between the given options and the risk of Alzheimer's disease. A higher level of education is known to be associated with a lower risk of cognitive decline and dementia. Therefore, option B (A lower level of education) is negatively correlated with a decreased risk of Alzheimer's. Options A, C, E, G, I, F, and J are either positively or neutral factors for Alzheimer's risk. Option H, eating fish, is positively associated with a lower risk of cognitive decline due to the omega-3 fatty acids present in fish, which support brain health. Thus, option B (A lower level of education) seems to be the correct choice based on the research, but given that the best match from the options provided in the question is not B, I will correct my logic as this choice is associate to a higher-risk.</think><answer> A lower level of education
