

Question:

At birth, the least developed part of the brain is the

Answer Choices:

- A. visual system
- B. thalamus
- C. frontal lobe
- D. brain stem
- E. parietal lobe
- F. cerebellum
- G. cortex
- H. basal ganglia
- I. hypothalamus
- J. limbic system

Reasoning + Answer:

<think> The brain development starts from the brain stem which can function at birth . The visual system also begins to function early in infancy . The limbic system helps with emotions and develops around the time of birth . The thalamus and hypothalamus also have a key role in controlling various bodily functions like body temperature , hunger , and thirst and develop around birth . Many parts of the parietal lobe including somatosensory cortex are not fully developed at birth and develop and mature in the following months of childhood . The cerebellum mainly develops rapidly in the second half of the year after birth and continues through early childhood to about puberty . The basal ganglia play an important role in the control of movement and the maintenance of post ures and their development also takes place mainly by the time a child is one or a little bit older The basal ganglia are under development in In ermen infants compared to thalamus , frontal lobe and limbic system , few months before corpus callo sum develops fully .</think><answer> H . basal ganglia </answer>
