

Question:
Which of the following factors is associated with a decreased risk of Alzheimer's?

Answer Choices:

- A. Being African or Hispanic American
- B. A lower level of education
- C. Living in a city
- D. Being married
- E. Having a family history of Alzheimer's
- F. High intake of saturated fats
- G. Older age
- H. Eating fish
- I. Being a smoker
- J. Drinking alcohol regularly

Reasoning + Answer:

<think>
We need to find the factor that is associated with a decreased risk of Alzheimer's . Let's evaluate each option :
- Being African or Hispanic American , lower level of education , and living in a city are not directly linked to a decreased risk of Alzheimer's , so we can exclude A , B , and C .
- Being married might be associated with social engagement and support , which could be protective against Alzheimer's , but there 's no strong evidence that it decreases the risk .
- Family history of Alzheimer's increases the risk , so we can exclude E .
- High intake of saturated fats and older age are linked to an increased risk , so we can exclude F and G .
- Eating fish is associated with omega - 3 fatty acids which are linked to a reduced risk of Alzheimer's .
- Smoking and drinking alcohol are risk factors for Alzheimer's , so we can exclude I and J .

Thus , the factor that is most directly linked to a decreased risk is eating fish .
