

Question:

Beatrice bought ten packets of crayons for her Art class. Six of the packets had eight pieces of colors each, and the other four packets had sixteen pieces of colors each. How many colors of crayons did Beatrice buy in all?

Reasoning + Answer:

<think>Beatrice bought 6 packets of crayons with 8 pieces in each, so that's $6 * 8 = 48$ crayons. She bought 4 packets of crayons with 16 pieces in each, so that's $4 * 16 = 64$ crayons. The total number of crayons Beatrice bought is $48 + 64 = 112$. So Beatrice bought 112 crayons in total. </think><answer>Beatrice bought 112 crayons in total. </answer>
