

Question:

It takes 240 minutes of walking to break in a new pair of shoes. Jason wants to try out for the track team in three weeks. If he can walk 4 days a week to break in the new shoes, how long does he have to spend walking each day?

Reasoning + Answer:

<think> Jason wants to break in his new shoes in 240 minutes. So, he has 3 weeks to break them. Number of days in 3 weeks is $3 \times 7 = 21$ days. Now, he can walk 4 days a week. To find out how long he has to walk each day, he will divide total days by number of walking days. So, time to walk each day = $\text{Total days} / \text{Number of walking days} = 21 / 4 = 5.25$. So, Jason has to spend 5.25 minutes walking each day to break in the new shoes </think> <answer> 5.25 </answer>
