

Question:

Tobias bought a big pizza with 60 pieces. He ate $\frac{2}{5}$ of the pieces on the first day, 10 pieces on the second day, and $\frac{7}{13}$ of the remaining pieces on the third day. How many pizza pieces has he eaten so far?

Reasoning + Answer:

<think> First, we determine how many pieces Tobias has eaten on the first day, $\frac{2}{5}$ of 60 is $(\frac{2}{5} * 60) = 24$, Now, he ate 10 more on the second day, So, total pieces eaten so far $= 24 + 10 = 34$, Now, finding out the remaining pieces after the second day, $60 - 34 = 26$, And, he ate $\frac{7}{13}$ of the remaining 26 pieces on the third day, That will be $(\frac{7}{13} * 26) = 17.74$, So, after the third day, total pieces eaten $= 34 + 17.74 = 51.74$, </think> <answer> 51.74 </answer>
