

Question:

Lee used to be able to run the 400-meter hurdles two seconds faster than Gerald would run the 400-meter hurdles. But Gerald changed his diet, which improved his speed by 10%. If Lee runs the 400-meter hurdles in 38 seconds, how fast can Gerald, with his improved diet, run the 400-meter hurdles, in seconds?

Reasoning + Answer:

<think>Lee ran 400 meter hurdles in 38 seconds. He used to run 2 seconds faster than Gerald. So Gerald used to run $38 - 2 = 36$ seconds. He got 10% improvement so 10% of 36 is 3.6. So he now runs $36 + 3.6 = 39.6$ </think><answer>39.6</answer>
