

Question:

A hospital sees 500 people a day. Each patient is seen for an average of 24 minutes. The doctors charge \$150 an hour to the hospital and the hospital charges the patients \$200 an hour. How much profit does the hospital make from these visits?

Reasoning + Answer:

<think>The total number of minutes seen by patients in a day is $500 \times 24 = 12000$ minutes
Since there are 60 minutes in an hour, the total number of hours seen by patients in a day is $12000 \div 60 = 200$ hours
So, the cost to the hospital for doctors' fees is $200 \times 150 = 30000$ dollars
And the hospital charges patients $500 \times 200 = 100000$ dollars
Therefore, the profit the hospital makes from these visits is $100000 - 30000 = 70000$ dollars
</think><answer>70000</answer>
