

Question:

A company sold 4000 gallons of milk in jars to Mr. Marcellus' store at the cost of \$3.5 per gallon. However, Mr. Marcellus later realized $\frac{2}{5}$ of the amount of milk he purchased had passed the expiry date and could not be sold. He returned the sour milk to the company and ordered a refund. Calculate how much he got in refunds.

Reasoning + Answer:

<think>The company sold 4000 gallons of milk to Mr. Marcellus at the cost of \$3.5 per gallon, so the total cost of the milk sold is: $[4000 \times 3.5 = 14000 \text{ dollars}]$ Mr. Marcellus returned $\frac{2}{5}$ of the amount of milk he purchased, which is: $[\frac{2}{5} \times 4000 = 1600 \text{ gallons}]$ Since the company refunds at the same cost per gallon, the amount of refund he got is: $[1600 \times 3.5 = 5600 \text{ dollars}]$ </think><answer>5600</answer>
