

Question:

44 seniors need to receive awards. Each senior receives a picture frame that costs \$20. Each picture frame needs to be etched with the logo for an additional 20% cost per frame. 2 of the seniors will also receive pins that are \$5. 1/4 of the seniors are officers and they will need to receive cords that are \$12 each. How much will be spent on the senior gifts?

Reasoning + Answer:

Step 1: The cost for 44 senior store receive a picture frame is : $\backslash [44 \backslash times 20 = 880 \backslash text \{ dollars \} \backslash]$ The additional cost to etch the logo for each frame is 20% of \$20 : $\backslash [20 \backslash times \backslash frac \{ 20 \} \{ 100 \} = 4 \backslash text \{ dollars per frame \} \backslash]$ Thus , the additional cost for etching the logos for all 44 frames is : $\backslash [44 \backslash times 4 = 176 \backslash text \{ dollars \} \backslash]$ The cost for 2 seniors to receive pins is : $\backslash [2 \backslash times 5 = 10 \backslash text \{ dollars \} \backslash]$ The cost for the cords for the officers (which is 1 / 4 of the seniors): $\backslash [\backslash frac \{ 1 \} \{ 4 \} \backslash times 44 = 11 \backslash text \{ seniors \} \backslash]$ Thus , the cost for the cords is : $\backslash [11 \backslash times 12 = 132 \backslash text \{ dollars \} \backslash]$ Therefore , the total amount spent on the senior gifts is : $\backslash [880 + 176 + 10 + 132 = 1218 \backslash text \{ dollars \} \backslash]$

Step 2: $\backslash [1218 \backslash]$
