

Question:

John buys milk for 2 dollars, eggs for 3 dollars, light bulbs for 3 dollars, cups for 3 dollars, and roach traps for 4 dollars. If there is a 10% tax on all nonfood items how much did everything cost.

Reasoning + Answer:

<think>First let's calculate the total cost of all the items. John buys milk for 2 dollars, eggs for 3 dollars, light bulbs for 3 dollars, cups for 3 dollars, and roach traps for 4 dollars. The total cost of these items is $2 + 3 + 3 + 3 + 4 = 15$ dollars. Now let's calculate the total cost including the tax. John buys nonfood items which are milk, light bulbs, cups, and roach traps. The total cost of these items is $3 + 3 + 3 + 4 = 13$ dollars. There is a 10% tax on all nonfood items. The tax on these items is $13 * 0.1 = 1.3$ dollars. Now let's calculate the total cost including the tax. The total cost of all items is 15 dollars. The total tax on nonfood items is 1.3 dollars. Therefore the total cost including the tax is $15 + 1.3 = 16.3$ dollars. Therefore the total cost of all items including the tax is 16.3 dollars. </think><answer>16.3</answer>
