

Question:

An 18-month-old boy presents to the pediatrician by his mother for a routine check-up. The mother has no concerns, although she asks about the "hole in his heart" that the patient had at birth. The patient has no history of cyanosis or heart failure; however, a holosystolic, harsh murmur was noted at the 3- and 6-month check-ups. On examination, the patient is playful and alert. He has met all developmental milestones. The cardiac examination reveals a regular rate and rhythm with persistence of the holosystolic, harsh murmur. What is the most likely cause of the murmur in this child? Answer Choices: A. Defect of muscular interventricular septum B. Defect of the membranous interventricular septum C. Defective dynein functioning D. Failure of endocardial cushion to form

Reasoning + Answer:

<think>reasoning process here</think><answer> A . Defect of muscular interventricular septum</answer>
