

Question:

A recent study shows that almost 40% of the antibiotics prescribed by primary care physicians in the ambulatory setting are for patients with a clinical presentation consistent with a viral acute respiratory tract infection. Recent evidence suggests that the implementation of a set of interventions may reduce such inappropriate prescribing. Which of the following strategies, amongst others, is most likely to achieve this goal? Answer Choices: A. C-reactive protein (CRP) testing B. Local peer comparison C. Procalcitonin testing D. Testing for non-antibiotic-appropriate diagnoses

Reasoning + Answer:

<think>reasoning process here </think><answer>D . Testing for non - antibiotic-appropriate diagnoses </answer>
