

Question:

A 35-year-old man developed headache, nausea, vomiting, and sore throat 8 weeks after returning from a trip abroad. He eventually refused to drink water and had episodes of profuse salivation, difficulty in breathing, and hallucinations. Two days after the patient died of cardiac arrest, it was learned that he had been bitten by a dog while on his trip. Which of the following treatments, if given immediately after the dog bite, could have helped prevent this disease? Answer Choices: A. Broad-spectrum antibiotics B. High-dose acyclovir C. IV ribavirin D. Rabies immune globulin plus rabies vaccine

Reasoning + Answer:

<think> The patient had a headache, nausea, and vomiting after a trip abroad. He refused to drink water, had salivation, and died from cardiac arrest. Rabies was mentioned as possible cause. Broad-spectrum antibiotics, high-dose acyclovir, and IV ribavirin were discussed as treatments for viral infections. Rabies immune globulin plus rabies vaccine were mentioned as preventive measures for rabies. </think> <answer> Rabies immune globulin plus rabies vaccine </answer>
